For the latest information on annotation of this clone, please see
http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=Kl3El3
Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.orml.gov/Grail-1.3/)
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGenes (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremulni.zool.iastate.edu/cgi.bin/sp.cgi).
Genes encoding tRNAs are predicted by tRNAscan-SE
(Sean Eddy, Washington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE/)
This sequence may not be the entire insert of this clone. It may be
shorter because we remove overlaps between neighboring submissions.
The 5' clone is MCB22 and the 3' clone is MHP21.

Genes with similarity to proteins in the databases are described
as 'putative', '-like' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://gnomic.cranford.edu/~chris/GENSCAN (Chris Burge,
http://gnomic.cranford.edu/~chris/GENSCAN (Laboratory,
NatplantGene (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/NerplantGene.html) and
ewotif(Nevill-Manning, C.G. Wu, T.D. & Brutlag, D.L.,
http://motif.stanford.edu/projects.html).

It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon a size is available and the accession number will be preserved.

Claim 1; SEQ ID NO 1817; 134pp; English.

This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up caracteristics. Specifically, it refers to identifying genes that are up care to man-regulated in transgenic plants oversypesshing the heterodimeric capen plant characteristics accordingly. The present invention describes calter plant characteristics are selected from increased vield or calter plant characteristics are selected from increased vield or blomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, blochemistry, signal or blomass, also be useful as positive or lacered photosynthesis, transduction, storage lipid mobilisation and/or altered photosynthesis, cransduction, storage lipid mobilisation and/or altered photosynthesis, each relative to the corresponding wild type plants. Accordingly, these cach relative to the corresponding wild type plants. Accordingly, these during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell or than such action factors. This polymucleotide sequence is thale cress oDNA repressed 1.3 fold or more in plants overexpressing the EZFa/DPa

                                                                                                                                                                       ,
                                                                                       The present invention provides the protein and coding sequences of Arabidopsis thaliana WRN1. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of corp plants, where they are able to control the timing of Ilowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is the VRN1 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      388

The present invention provides the protein and coding sequences of Arabidopsis thaliana VRNI. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of Ilowaring, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is the VRNI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel VRNI polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRNI nucleic acid is expressed, useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3120 AGGGTCCCCAGATAAGTTTGTGAGTAAATTCAAGGATGAGCTTTCGGTTGCTGTTGCACTC

                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid array or goods of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abloric stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZINJS-6-ABZINJS-4) used in methods of the invention. Note: The sequence data for this patent is not respresented in the printed specification but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                  GlnGlyTrpTyrGluPheThrLeuGluAsnAsnLeuGlyGluGlyAspValCysValPhe 320

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes an Arabacopsis unaidant anciera actu, it.e.

The invention describes an Arabacopsis unaidate agent (III) or polypeptide (II) encoded by (I), transgenic plant (III) or genetically modified cell (IV) are useful for screening a candidate agent for its biological effect, by combining the candidate agent with (II), (III) or (IV), and determining the effect of the candidate agent on (II), (III) or (IV), is useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of its encoded protein, for mapping functional regions of the protein, in diagnosis, for studying associated physiological pathways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of continuing polypeptides, as probes for the detection of mRNA in biological or inhibiting production of biosynthetic product in a plant, for producing polypeptides, as probes for the detection of mRNA in biological camples, to generate additional copies of (I), to generate ribozymes or oligonucleotides, as single stranded DNA probes or as triple-strand for amplement of introducing or improving disease resistance and stress consistence in plants, such as plant cells and plants, (II) or (III) is useful for introducing or improving disease resistance and stress consistence in plants, screening biological active agents, e.g., fungicides, insecticides, etc., and for elucidating biochemical pathways. CC (III) is useful as crops for their enhanced diseased resistance, enhanced tolerance to environmental stress, or to produce a factor. This enquence represents a nucleic acid that may correspond to naturally cocurring Arabidopsis thaliana expressed sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obstance the sequence the may correspond to naturally coversing Arabidopsis thaliana expresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel Arabidopsis thaliana nucleic acid useful for identifying homologous or related genes, and to create genetically modified and transgenic organisms, such as plant cells and plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Yu Y;

```
The invention comprises the amino acid and coding sequences of proteins involved in the control of flowering time in rice. The DNA and protein sequences of the invention are useful for modulating flower architecture and flowering time, the DNA and protein sequences are useful in the area of plant biotechnology, commercial plant farming and agriculture. The present wheat DNA sequence shows homology to the rice sequences of the

The DNA and protein sequences of the invention are useful for modulating flower architecture and flowering time, the DNA and protein sequences are useful in the area of plant biotechnology, commercial plant farming and agriculture. The present DNA sequence encodes a rice flowering-related protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
